Each signature verifies on its own, against its own public key, without the other and without anything of ours.
One signature is not a seal: if either witness is unreachable, no seal is produced. Both chips are the same make and model, provisioned and owned by the issuer — independent in custody and location, not in supply chain or ownership.

How to verify this without the Issuer, in six steps

(1) Extract JFD-20260926-PP-00002.pdf from this PDF's attachments and hash it as stored, with no normalisation. Its SHA-256 must equal the fingerprint above.

(2) Read ledger event 3171918 by its id. Its payload must carry that fingerprint as doc_sha256 and JFD-20260926-PP-00002 as dcn.

(3) Verify witness 1's signature as ECDSA over P-256, with the public key above, over the seal request bytes whose SHA-256 is c3896476114d0eeafb1fa3bfaaf9eeae7d5ed476218f6ab800da7f797e477b27.

(4) Verify witness 2's signature the same way. Each signature must verify under its own key and fail under the other's.

(5) Read the OpenTimestamps proof against the same fingerprint. Until a Bitcoin attestation is confirmed the anchor is PENDING, and this certificate says so.

(6) Open <https://gh.jetfyul.com/v/JFD-20260926-PP-00002> and confirm it shows the same fingerprint, ledger event, witnesses and anchor.

This certificate goes to what the record is and that it has not been altered. It is not a sworn declaration and does not assert the truth of anything the document says.
